How the original patches are partitioned before and after scaling

Same 12,760 patches from all 319 original slides; one shared t-SNE layout

Before: 319 slides / k=100

After: 3,441 slides / k=100

After: 3,441 slides / k=2,000

Selected candidates: 19 clusters in full run
20.0% of displayed original patches

Selected candidates: 6 clusters in full run
19.2% of displayed original patches

Selected candidates: 330 clusters in full run
21.0% of displayed original patches

Top: saved cluster IDs (colors are independent in each run). Bottom: selected candidate patches in orange.

Descriptive comparison: PCA fit, training sample and assignment method also differ. 2D overlap does not measure cluster quality.
